### **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

### IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

     Compds. and methods for the diagnosis and treatment of B.
AB
    microtiinfection are disclosed. The compds. provided include
     polypeptides that contain at least one antigenic portion of a B.
    microtiantigen and DNA sequences encoding such polypeptides.
    Antigenic epitopes of such antigens are also provided, together with
     pharmaceutical compns. and immunogenic compns. comprising such
     polypeptides, DNA sequences or antigenic epitopes. Diagnostic kits
     contg. such polypeptides, DNA sequences or antigenic epitopes and a
     suitable detection reagent may be used for the detection of B.
    microtiinfection in patients and biol. samples. Antibodies directed
     against such polypeptides and antigenic epitopes are also provided.

CORPORATE SOURCE: Corixa Corporation, Seattle, WA, 98104, USA SOURCE: Infection and Immunity (2000), 68(5), 2783-2790 CODEN: INFIBR; ISSN: 0019-9567 American Society for Microbiology PUBLISHER: Journal DOCUMENT TYPE: English LANGUAGE: Increased recognition of the prevalence of human babesiosis in the United States, together with rising concern about the potential for transmission of this infection by blood transfusion, has provided motivation to develop definitive serol. and mol. tests for the causative agent, Babesia microti. To develop more sensitive and specific assays for B. microti, the authors screened a genomic expression library with patient serum pools. This screening resulted in the identification of three classes of

Searcher: Shears 308-4994

novel genes and an addnl. two novel, unrelated genes, which together

encode a total of 17 unique B. microti antigens. The first class (BMN1-2 family) of genes encodes seven closely related antigens with a degenerate six-amino-acid repeat that shows limited homol. to Plasmodium sp. merozoite and sporozoite surface antigens. A second class (BMN1-8 family) of genes encodes six related antigens, and the third class (BMN1-17 family) of genes encodes two related antigens. The two remaining genes code for novel and unrelated sequences. Among the three classes of antigens and remaining novel sequences, five were chosen to code for the most immunodominant antigens (BMN1-2, -9, -15, and -17 and MN-10). Western blot anal. with the resulting recombinant proteins indicated that these antigens were targets of humoral immune responses during B. microti infection in humans.

US 2000-656688 A2 20000907 US 2000-685436 A2 20001010 Compds. and methods for the diagnosis and treatment of Babesia AB microti infection are disclosed. The compds. provided include polypeptides that contain at least one antigenic portion of a B. microti antigen and DNA sequences encoding such polypeptides. Nine antigens share some homol., contain a degenerate repeat of six amino acids with 9-22 repeats occurring in each antigen, and bear some similarity to a Plasmodium falciparum merozoite surface antigen gene. A second group of five antigens bear some homol. to each other but do not show homol. to any previously identified sequences. Two synthetic peptides (BABS-1 and BABS-4) were made to the repeat region of isolated B. microti antigen BMNI-3. Twelve BMNI-6 homologs were obtained from hamster and human patients. Antigenic epitopes of such antigens are also provided, together with pharmaceutical compns. and vaccines comprising such polypeptides, DNA sequences or antigenic epitopes. Diagnostic kits contg. such polypeptides, DNA sequences or antigenic epitopes and a suitable detection reagent may be used for the detection of B. microti infection in patients and biol. samples. Antibodies directed against such polypeptides and antigenic epitopes are also provided. 				US 1997-845258 A	19970424

AB Antigens and epitopes of Babesia microti that can be used in the diagnosis and treatment of infection are described. Genes for the antigens or antibodies against them can be used in the detection of B. microti. CDNAS for these antigens were cloned by screening an expression library in .lambda.ZAP with antiserum to B. microti.

IT 205488-48-8 205488-54-6 206205-11-0 206205-12-1 206205-13-2 206205-16-5 206205-20-1 206205-21-2 206205-23-4 206205-33-6 206205-35-8 206205-36-9

RL: ANT (Analyte); BSU (Biological study, unclassified); PRP (Properties); THU (Therapeutic use); ANST (Analytical study); BIOL (Biological study); USES (Uses)

(amino acid sequence; antigens of Babesia microtia and their use in diagnosis and treatment of infection)

     Compns. and methods for the therapy of malignant diseases, such as
ΑB
     leukemia and cancer, are disclosed. The compns. comprise one or
     more of a WT1 polynucleotide, a WT1 polypeptide, an
     antigen-presenting cell presenting a WT1 polypeptide, an antibody
     that specifically binds to a WT1 polypeptide; or a T cell that
     specifically reacts with a WT1 polypeptide. Such compns. may be
     used, for example, for the prevention and treatment of metastatic
     diseases.

    Compds. and methods for the diagnosis and treatment of B.
AΒ
    microti infection are disclosed. The compds. provided
    include polypeptides that contain at least one antigenic portion of
    a B. microti antigen and DNA sequences encoding such
    polypeptides. Antigenic epitopes of such antigens are also
    provided, together with pharmaceutical compns. and immunogenic
    compns. comprising such polypeptides, DNA sequences or antigenic
    epitopes. Diagnostic kits contg. such polypeptides, DNA sequences
    or antigenic epitopes and a suitable detection reagent may be used
    for the detection of B. microti infection in patients and
    biol. samples. Antibodies directed against such polypeptides and
    antigenic epitopes are also provided.
                                                      DUPLICATE 3

AΒ
     Compds. and methods for the diagnosis and treatment of B.
    microtiinfection are disclosed. The compds. provided include
    polypeptides that contain at least one antigenic portion of a B.
    microtiantigen and DNA sequences encoding such polypeptides.
    Antigenic epitopes of such antigens are also provided, together with
    pharmaceutical compns. and immunogenic compns. comprising such
    polypeptides, DNA sequences or antigenic epitopes. Diagnostic kits
     contg. such polypeptides, DNA sequences or antigenic epitopes and a
     suitable detection reagent may be used for the detection of B.
     microtiinfection in patients and biol. samples. Antibodies directed
     against such polypeptides and antigenic epitopes are also provided.

MB Compds. and methods for the diagnosis and treatment of Babesia microti infection are disclosed. The compds. provided include polypeptides that contain at least one antigenic portion of a B. microti antigen and DNA sequences encoding such polypeptides. Antigenic epitopes of such antigens are also provided, together with pharmaceutical compns. and vaccines comprising such polypeptides, DNA sequences or antigenic epitopes. Diagnostic kits contg. such polypeptides, DNA sequences or antigenic epitopes and a suitable detection reagent may be used for the detection of B. microti infection in patients and biol. samples. Antibodies directed against such polypeptides and antigenic epitopes are also provided.

AB WO 200185949 A UPAB: 20020701

NOVELTY - An isolated polynucleotide (I) comprising a sequence (S1) chosen from 36 nucleotides of defined bp fully in the specification such as 1345, 1132, 554, 559, 201, 467, 530, 1185, 1131, 800, 1011, 513, 464, 527, 464, 860, 484 or 1039 bp, complement of (S1), a sequence hybridizable under moderate stringent conditions to (S1), a sequence which is 75% or 90% identical to (S1) or degenerate variant of (S1), is new.

DETAILED DESCRIPTION - (I) is chosen from the determined DNA sequence of human granulocytic ehrlichiosis (HGE)-1, HGE-3, HGE-6, HGE-8, HGE-11-13, HGE-23, HGE-24, the 5' DNA sequence of HGE-7, HGE-2, HGE-9, HGE-14-18, HGE-25, extended DNA sequences of HGE-2, HGE-7, HGE-8, HGE-11, HGE-14-16, HGE-18, HGE-23, HGE-25, the determined 3' DNA sequence of HGE-17, the full-length cDNA sequence for HGE-17, corrected cDNA sequence for HGE-14, HGE-1, and the reverse complement of HGE-2, HGE-14 and HGE-15. INDEPENDENT CLAIMS are also included for the following:

- (1) an isolated polypeptide ( $\overline{\text{II}}$ ) comprising a sequence encoded by ( $\overline{\text{II}}$ ) or a sequence 70% or 90% identical to a sequence encoded by ( $\overline{\text{II}}$ );
- (2) an isolated antigenic epitope (III) of an Ehrlichia antigen comprising a sequence of 41 or 125 amino acids defined in the specification;
- (3) an isolated polypeptide comprising at least two antigenic epitopes as above;
  - (4) a recombinant expression vector (IV) comprising (I);
  - (5) a host cell (V) transformed with (IV);
  - (6) a fusion protein (VI) comprising (II) or (III);
- (7) a diagnostic kit comprising (II), (III) and (VI) and a detection reagent;
- (8) a diagnostic kit comprising at least two oligonucleotide probes or primer specific for (I);
- (9) an isolated antibody (VII), or its antigen binding fragment that specifically binds to (II) or (III);
- (10) a composition (VIII) comprising any one chosen from (I)-(III), (VI) and (VII), and immunostimulants;
- (11) detecting Ehrlichia infection in a biological sample, by contacting the sample with oligonucleotide primers or probes, or a

binding agent capable of binding to (II), (III) or (VI) and detecting in the sample the presence of amplified polynucleotide sequence, polynucleotide sequence that hybridizes to the probe or polypeptide that binds to the binding agent; and

(12) detecting a disorder of Ehrlichia infection, Lyme disease and B.microti infection in a patient, by contacting the biological sample with (II), a Lyme disease antigen, and a B. microti antigen, and detecting the presence of antibodies in the biological sample that bind to either the polypeptide, Lyme disease antigen or the B.microti antigen.

ACTIVITY - Antibiotic. No supporting data is provided. MECHANISM OF ACTION - Vaccine. No supporting data is given. USE - (II), (III) and (VI) are useful for detecting Ehrlichia infection in a patient. (VIII) is useful for stimulating an immune response in a patient, for treating Ehrlichia infection in a patient (claimed). (II) is useful for serodiagnosis and treatment of human granulocytic ehrlichiosis (HGE). (VII) is useful in diagnostic test to detect the presence of Ehrlichia antigens and for detecting Ehrlichia infection in a patient. Dwg.0/2

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\*

Infection of severe combined immunodeficient mice with Babesia AΒ sp. strain WA1 was studied to assess the contributions of innate and adaptive immunity in resistance to acute babesiosis. The scid mutation showed little effect in genetically susceptible C3H mice and did not decrease the inherent resistance of C57BL/6 mice to the infection, suggesting that innate immunity plays a central role in determining the course of Babesia infection in these strains. In contrast, the scid mutation dramatically impaired resistance in moderately susceptible BALB/c mice, suggesting that acquired immunity may play an important secondary role. In comparison to their female counterparts, male mice of different genetic backgrounds showed increased resistance to the infection, indicating that the gender of the host may influence protection against babesiosis.

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\*

A panel of seven recombinant antigens, derived from Ehrlichia AΒ phagocytophila (the agent of human granulocytic ehrlichiosis), was evaluated by class-specific enzyme-linked immunosorbent assays (ELISAs) for utility in the diagnosis of the infection. Fourteen genomic fragments, obtained by serologic expression screening, contained open reading frames (ORFs) encoding 16 immunodominant antigens, Eleven of these antigens were members of the major surface protein (MSP) multigene family, Alignment of their predicted protein sequences revealed a pattern of conserved sequences, which contained short direct repeats, flanking a variable region. In addition, two genomic clones contained two and three MSP ORFs, respectively, indicating that these genes are clustered in tandem copies. The implications for this pattern of both genomic and protein arrangements in antigenic variations of MSPs and in their utilities in a diagnostic assay are discussed. In addition to two :MSP recombinant antigens (rHGE-1 and -3) and a fusion protein of these antigens (rErf-1), five further recombinants were evaluated by ELISA. Two of these antigens (rHGE-14 and -15) were novel, while a third (rHGE-2), with no known function, has been described. The final two recombinant antigens (rHGE-9 and -17) represent overlapping segments of the ankyrin gene (ank), The addition of rHGE-9 ELISA data resulted in the detection of 78% (21 of 27) of acute-phase sera. When serologic data for all recombinants are combined, 96.2% (26 of 27) of convalescent-phase patient serum samples and 85.2% (23 of 27) of acute-phase patient serum samples are detected, indicating the potential of these antigens for use in the development of a rapid serologic assay for the detection of E. phagocytophila infection.

OTHER SOURCE(S):
     Compds. and methods for the diagnosis and treatment of B. microtia
     infection are disclosed. The compds. provided include polypeptides
     that contain at least one antigenic portion of a B. microtia antigen
     and DNA sequences encoding such polypeptides. Antigenic epitopes of
     such antigens are also provided, together with pharmaceutical
     compns. and vaccines comprising such polypeptides, DNA sequences or
     antigenic epitopes. Diagnostic kits contg. such polypeptides, DNA
     sequences or antigenic epitopes and a suitable detection reagent may
     be used for the detection of B. microtia infection in patients and
     biol. samples. Antibodies directed against such polypeptides and
     antigenic epitopes are also provided. Cloning of antigen genes by
     antibody screening of expression libraries with antiserum.
     Seventeen antigens were identified and several of these showed
     common sequences. The clones also contained telomere repeat
     sequences indicating that they were located near the telomere. Use
     of the antigens in diagnostic detection of B. microtia is
     demonstrated.

NOVELTY - A polypeptide (P) comprising an immunogenic portion of an Ehrlichiaantigen or its variant that is encoded by one of 18 DNA sequences of 201-7091 base pairs (bp) (I)-(XVIII) (all sequences fully defined in the specification), their complements and DNA sequences that hybridize to sequences (I)-(XVIII), are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for

the following:

- (1) An antigenic epitope (E) of an Ehrlichia antigen comprising an amino acid sequence of (XIX) or (XX) consisting of 41 and 125 amino acids (aa) respectively;
  - (2) A polypeptide (P') comprising at least two of (E);
- (3) A DNA molecule (N) comprising a nucleotide sequence encoding (P) or (P');
  - (4) A recombinant expression vector (V) comprising (N);

(5) A host cell (H) transformed with (N);

- (6) A fusion protein (F) comprising either at least one of (P) or (P') and/or at least one of (E) or a 376 aa sequence (XXI) and/or a 325 aa sequence (XXII).
- (7) detecting Ehrlichia infection, Lyme disease and Babesia microtiinfection in a patient comprising:
- (a) contacting a biological sample with at least one of (E), (P), (P') or (F) and a Lyme disease antigen and a B.microti antigen; and
- (b) detecting the presence of antibodies that bind to (E), (P), (P') or (F) or the Lyme disease antigen or the B.microti antigen in the sample;
  - (8) A method similar to (7), comprising:
- (a) contacting a biological sample with a specific binding agent to at least one of (E), (P), (P') or (F) or a Lyme disease antigen and a B.microti antigen; and
- (b) detecting a polypeptide that binds to the binding agent, thereby detecting Ehrlichiainfection;
  - (9) A method similar to (7), comprising:
- (a) contacting the sample with one or more probe oligonucleotides (or at least two primer oligonucleotides in a PCR reaction) where at least one is specific for (N); and
- (b) detecting in the sample a DNA sequence that hybridizes to (or amplifies in the presence of) the oligonucleotide primers, thereby detecting Ehrlichia infection;
  - (10) A diagnostic kit (K) comprising:
  - (a) at least one of (P), (P'), (E) or (F); and
  - (b) a detection agent;
- (11) A diagnostic kit (K') comprising at least two oligonucleotide primers or one oligonucleotide probe whereby at least one is specific for (N);
- (12) A monoclonal antibody or polyclonal antibody that binds to (P), (P') or (E); and
- (13) Vaccines comprising at least one of (P), (P'), (N) or (E) and a non-specific immune enhancer such as an adjuvant;
- (14) A polypeptide comrpising an immunogenic portion of an Erlichia antigen associated with human granulocytic erlichiosis or its variant.
  - All sequences are fully defined in the specification. USE (P), (P'), (N), (F) and/or (E) are useful for the

detection and treatment of Ehrlichiainfection. (P), (P'), (F) and/or (E) can also be used to detect Lyme disease and B.microtiinfection. In particular, (P') can be used for the serodiagnosis and treatment of human granulocytic ehrlichiosis (HGE). Compositions of (P) or (P'), (N) and (E) can be used in the manufacture of a medicament for inducing protective immunity in a patient. The new vaccines are also used for inducing protective immunity in a patient.

ADVANTAGE - None given.

LANGUAGE: Increased recognition of the prevalence of human babesiosis in the United States, together with rising concern about the potential for transmission of this infection by blood transfusion, has provided motivation to develop definitive serol. and mol. tests for the causative agent, Babesia microti. To develop more sensitive and specific assays for B. microti, the authors screened a genomic expression library with patient serum pools. This screening resulted in the identification of three classes of novel genes and an addnl. two novel, unrelated genes, which together encode a total of 17 unique B. microti antigens. The first class (BMN1-2 family) of genes encodes seven closely related antigens with a degenerate six-amino-acid repeat that shows limited homol. to Plasmodium sp. merozoite and sporozoite surface antigens. A second class (BMN1-8 family) of genes encodes six related antigens, and the third class (BMN1-17 family) of genes encodes two related antigens. The two remaining genes code for novel and unrelated sequences. Among the three classes of antigens and remaining novel sequences, five were chosen to code for the most immunodominant antigens (BMN1-2, -9, -15, and -17 and MN-10). Western blot anal. with the resulting recombinant proteins indicated that these antigens were targets of humoral immune responses during B. microti infection in humans.

Babesiosis is an emerging, tick-transmitted, zoonotic disease caused AB by hematotropic parasites of the genus Babesial Babesial parasites (and those of the closely related genus Theileria) are some of the most ubiquitous and widespread blood parasites in the world, second only to the trypanosomes, and consequently have considerable worldwide economic, medical, and veterinary impact. The parasites are intraerythrocytic and are commonly called piroplasms due to the pear-shaped forms found within infected red blood cells. The piroplasms are transmitted by ixodid ticks and are capable of infecting a wide variety of vertebrate hosts which are competent in maintaining the transmission cycle. Studies involving animal hosts other than humans have contributed significantly to our understanding of the disease process, including possible pathogenic mechanisms of the parasite and immunological responses of the host. To date, there are several species of Babesia that can infect humans, Babesia microti being the most prevalent. Infections with Babesia species generally follow regional distributions; cases in the United States are caused primarily by B. microti, whereas cases in Europe are usually caused by Babesia divergens. The spectrum of disease manifestation is broad, ranging from a silent infection to a fulminant, malaria-like disease, resulting in severe hemolysis and occasionally in death. Recent advances have resulted in the development of several diagnostic tests which have increased the level of sensitivity in detection, thereby facilitating diagnosis, expediting appropriate patient management, and resulting in a more accurate epidemiological description.

Human babesiosis in the United States is caused predominantly by AΒ Babesia microti, a tick-transmitted blood parasite. Improved testing methods for the detection of infection with this parasite are needed, since asymptomatic B. microti infection represents a potential threat to the blood supply in areas where B. microti is endemic. We performed immunoscreening of an expression library of genomic DNA from a human isolate of B. microti (strain MN1). Among 17 unique immunoreactive clones, we identified 9 which represent a related family of genes with little sequence homol. to other known sequences but with an architecture resembling that of several surface proteins of Plasmodium. Within this family, a tandem array of a degenerate six-amino-acid repeat (SEAGGP, SEAGWP, SGTGWP, SGTVGP) was found in various lengths between relatively well conserved segments at the N and C termini. In order to examine within-clone variation, we developed a PCR protocol for direct recovery of a specific bmn1-6 homolog directly from 30 human blood isolates, 4 corresponding hamster isolates, and 5 geog. corresponding Peromyscus leucopus (white-footed mouse) isolates. Isolates from the hamsters had the same sequences as those found in the corresponding human blood, suggesting that genetic variation of bmn1-6 does not occur during passage. However, clones from different patients were often substantially different from each other with regard to the no. and location of the degenerate repeats within the bmn1-6 homolog. Moreover, we found that strains that were closely related geog. were also closely related at the sequence level; nine patients, all from Nantucket Island, Mass., harbored clones that were indistinguishable from each other but that were distinct from those found in other northeastern or upper midwestern strains. We conclude that considerable genetic and antigenic diversity exists among isolates of B. microti from the United States and that geog. clustering of subtypes may exist. The nature of the bmn1-6 gene family suggests a mechanism of antigenic variation in B. microti that may occur by recombination, differential

expression, or a combination of both mechanisms.

PUBLISHER: DOCUMENT TYPE: Journal English LANGUAGE:

A tetrapeptide and a recombinant protein, each representing 4 AB immunodominant epitopes of Trypanosoma cruzi, were tested by use of ELISA for the detection of serum antibodies. Sera from individuals with Chagas' disease, including persons untreated and successfully or unsuccessfully treated, were tested. These assays detected antibody in 100% of the parasitemias. The antibody reactivity decreased based on the success of treatment. Higher sensitivity was obsd. for tetrapeptide/recombinant protein assays than for lysate-based ELISA, and specificity was improved, particularly with Leishmania sera. The results indicate that multiepitope antigens provide a more sensitive and specific alternative to lysate for detection of anti-T. cruzi antibodies, as required for developing

blood screening assays. REFERENCE COUNT:

Compds. and methods for the diagnosis and treatment of Babesia microti infection are disclosed. The compds. provided include polypeptides that contain at least one antigenic portion of a B. microti antigen and DNA sequences encoding such polypeptides. Nine antigens share some homol., contain a degenerate repeat of six amino acids with 9-22 repeats occurring in each antigen, and bear some similarity to a Plasmodium falciparum merozoite surface antigen gene. A second group of five antigens bear some homol. to each other but do not show homol. to any previously identified sequences. Two synthetic peptides (BABS-1 and BABS-4) were made to the repeat region of isolated B. microti antigen BMNI-3. Twelve BMNI-6 homologs were obtained from hamster and human patients. Antigenic epitopes of such antigens are also provided, together with pharmaceutical compns. and vaccines comprising such polypeptides, DNA sequences or antigenic epitopes. Diagnostic kits contg. such polypeptides, DNA

sequences or antigenic epitopes and a suitable detection reagent may be used for the detection of B. microti infection in patients and biol. samples. Antibodies directed against such

polypeptides and antigenic epitopes are also provided.

Blood smear evaluation of two baboons (Papio cynocephalus) AΒ experiencing acute hemolytic crises following experimental stem cell transplantation revealed numerous intraerythrocytic organisms typical of the genus Babesia. Both animals had received whole-blood transfusions from two baboon donors, one of which was subsequently found to display rare trophozoites of Entopolypoides macaci. An investigation was then undertaken to determine the prevalence of hematozoa in baboons held in our primate colony and to determine the relationship, if any, between the involved species. Analysis of thick and thin blood films from 65 healthy baboons (23 originating from our breeding facility, 26 originating from an out-of-state breeding facility, and 16 imported from Africa) for hematozoa revealed rare E. macaci parasites in 31%, with respective prevalences of 39, 35, and 12%. Phylogenetic analysis of nuclear small-subunit rRNA gene sequences amplified from peripheral blood of a baboon chronically infected with E. macaci demonstrated this parasite to be most closely related to Babesia microti (97.9% sequence similarity); sera from infected animals did not react in indirect fluorescent-antibody tests with Babesia microti antigen, however, suggesting that they represent different species. These results support an emerging view that the genus Entopolypoides Mayer 1933 is synonymous with that of the genus Babesia Starcovici 1893 and that the morphological variation noted

among intracellular forms is a function of alteration in host immune status. The presence of an underrecognized, but highly enzootic, Babesia sp. in baboons may result in substantial, unanticipated impact on research programs. The similarity of this parasite to the known human pathogen B. microti may also pose risks to humans undergoing xenotransplantation, mandating effective screening of donor animals.

DOCUMENT TYPE: Journal LANGUAGE: English

Peptide epitopes of Trypanosoma cruzi have been identified through expression cloning. A tripeptide (2/D/E) contg. three epitopes (TcD, TcE, PEP-2) was used in ELISA to detect antibodies to T. cruzi in 239 of 240 consensus-pos. sera and 41 of 42 sera confirmed pos. by radioimmunopptn. assay. The 1 discrepant consensus-pos. serum was used to expression-clone a novel gene that contained a repeat sequence. A peptide corresponding to this sequence, TcLo1.2, was specific for T. cruzi. This antigen detected the discrepant consensus-pos. serum and enhanced reactivity of low-pos. sera in the tripeptide assay. A branched synthetic peptide, 2/D/E/Lo1.2, or a linear recombinant, r2/D/E/Lo1.2, realized all of the diagnostic features of the 4 epitopes, including the ability to boost reactivity of low-reactive sera. Thus, peptides and recombinants contg. multiple repeat epitopes are powerful tools for developing assays for T. cruzi antibody detection and have direct application in blood screening.

AB Antigens and epitopes of Babesia microti that can be used in the diagnosis and treatment of infection are described. Genes for the antigens or antibodies against them can be used in the detection of B. microti. CDNAS for these antigens were cloned by screening an expression library in .lambda.ZAP with antiserum to B. microti.

AN 1998-609891 [51] WPIDS

CR 2000-160675 [11]; 2002-062250 [01]

AB WO 9842740 A UPAB: 20020701

A polypeptide comprising an immunogenic portion of an Ehrlichia antigen (or variant differing by conservative substitutions and/or modifications) is new, in which the antigen has amino acid sequence encoded by:

- (i) one of nineteen 201-7091 bp sequences given in the specification, encoding Ehrlichia antigens;
  - (ii) sequences hybridising to (i); or
  - (iii) complements of (i) or (ii).

Also claimed are:

- (1) an antigenic epitope of an Ehrlichia antigen with the 41 or 125 amino acid sequences (I) or (II) given in the specification, and a second polypeptide comprising at least two such antigenic epitopes.
  - (2) DNA molecules encoding polypeptides as above;
  - (3) expression vectors comprising (2);
- (4) host cells (e.g. E. coli, yeast or mammalian) transformed
  with (3);
- (5) fusion proteins comprising at least one of polypeptides and/or at least one of antigenic epitopes;
- (6) diagnostic kits comprising at least one polypeptide/antigenic epitope/fusion protein (optionally immobilised on solid support e.g. nitrocellulose) plus detection reagent (optionally comprising reporter group e.g. radioisotope conjugated to binding agent e.g. anti-immunoglobulin; and
- (7) monoclonal/polyclonal antibodies binding to polypeptides/antigenic epitope.
- USE The polypeptides are useful in the treatment of Ehrlichia infection, and as vaccines for the prevention of infection (claimed). They preferably comprise an immunogenic portion of an Ehrlichia antigen associated with human granulocytic ehrlichiosis (or a variant) (claimed) and are thus especially useful in the treatment of human granulocytic ehrlichiosis (HGE). The polypeptides, antigenic epitopes or DNA molecules can be combined with a suitable carrier in pharmaceutical compositions (claimed).

Such compositions and the vaccines of (7) are useful to manufacture medicaments for inducing protective immunity against Ehrlichia infection in patients (claimed), especially against HGE. The polypeptides/antigenic epitopes/fusion proteins are also useful to detect such infections in patients, by contacting biological samples (e.g. serum, and especially whole blood (claimed) with at least 1 polypeptide/antigenic epitope/fusion protein and detecting antibody binding (claimed). They can also be used to produce antibodies useful in diagnosis of such infections. The DNA molecules of (2) are similarly useful for diagnosing such infections (claimed). HGE is caused by a rodent bacterium normally transmitted to humans by the same tick which transmits Lyme disease and babesiosis. Co-infection with these diseases is thus possible, and the polypeptides/antigenic epitopes/fusion proteins may be used in methods to detect at least one of Ehrlichia infection, Lyme disease or B. microti infection in patients, by contacting samples (e.g. whole blood, saliva etc.) with at least one polypeptide/antigenic epitope/fusion protein, a Lyme disease antigen and a B. microti antigen, and detecting antibody binding (claimed); kits are provided (claimed).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.

the treatment, proteins and their associated DNA sequences are used in the treatment, prevention and diagnosts of medical conditions caused by pustulosis, hypertosis and osteonyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes proteins. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by once: The sequence data for this patent did not form part of the printed in the intention, but was obtained in electronic format directly from WIPO

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving constituting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponential diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human and approach of the printed invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central. nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and ostecomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a blinding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies opperative for a cares proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

C. Note: The sequence data for this patent did not form part of the printed presence of the contact of the printed presence of the contact of the printed presence of the printed pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-SEP-2000;
                                                                                                                                                                                                                                                                                                                                    14-AUG-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14-SEP-2000;
                                                                                                                                                                                                                          Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (Synovitis, acne, contactions is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downrequlate expression and activity of P. acnes polypeptides and cherraining P. acnes proteins. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme immunosorbent assay (ELISA).

Configuration, but was obtained in electronic format directly from WIPPO CC at fitp.WiPpo.int/Pub/Published_pct_sequences.

```
activity, and can be used in gene therapy and vaccine production. (I)

activity, and can be used in gene therapy and vaccine production. (I)

creatment of diseases may be used in the prevention, diagnosis and

treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased

expression by rectifying mutations or deletions in a patient's genome

that affect the activity of (I) by expressing inactive proteins or to

supplement the patients own production of (I). Additionally, (I)

polynucleotides may be used to produce the secreted (I), by inserting

to another acids into a host cell and culturing the cell to express the

protein. (I) proteins and polynucleotides may be used to prevent,

diagnose and treat immune/haematopoietic-related diseases, especially

cancers and cancer metastases of haematopoietic-derived cells. AAK64703

to AAK87694 represent human immune/haematopoietic antigen genomic

sequences from the present invention. AAK34942 to AAK84950 and AAM82169

represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel human nucleic acid (cDNA) sequences (A), that are highly expressed in uterine tumour tissue and which have anticancer and cytostatic activity. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or are used (i) to identify agents suitable for treatment of uterine or dometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid sequences expressed in uterine cancer tissues, and derived polypeptides, for treatment of uterine and endometrial cancer and identification of therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Endometrium; human; tumour; cancer; anticancer; cytostatic; EST:

(expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular itssue. AAXS9941-Y6032B represent protein fragments encoded by the human endometrium tumour cDNA library derived EST fragments represented in AAZ41981-Z42121.
                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibody that interacts with collagen binding domain of Staphylococcal cna gene product - useful to prevent bacterial sepsis in animal infected with Staphylococcus aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This protein comprises Staphylococcus aureus collagen binding protein (CBP) epitope MI7, i.e. amino acids 151-297 of full-length CBP, plus a vector derived N-terminal peptide. Claimed 441, 849 and 1500 bp nucleic acid sequences (see AAT93436-38) respectively encode CBP epitopes MI7, MI3 and MB5 (see AAM91552-54) that confer protection against S. aureus infection. These nucleic acid sequences can be used in the recombinant production of the CBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Collagen binding protein; ona gene; sepsis; infection; microbial surface component regonising adhesive matrix molecule; MSCRAMM; adhesin; vaccine; immunisation; diagnosis; therapy;

                                                                                                                                                                                                        Gaps
epitopes. The CBP protein and antigenic epitopes are contemplated for use in the treatment of pathological infections, especially to prevent bacterial adhesion to collagen. The claimed nucleic acids as well as claimed anti-CBP antibodies will also be of use in screening, diagnostic and therapeutic applications including active and passive immunisation and methods for the prevention of bacterial colonisation in an animal such as a human. The CBP epitopes are also contemplated for use in the preparation of vaccines and as carrier proteins in vaccine formulations, as well as in the formulation of compositions for the prevention of S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         οŧ

The sequences given in AAR39712-13 represent varient neutral proteases based on the Aspergillus oryzae protease sequence (see also AAR39711).
                                                                                                                                                                                                                                                                      This sequence represents a wildtype protease which may be used as the basis for the production of a varient neutral protease. The varient protease has either Cys6 or Cys78 substituted with an amino acid which has no -SH group. The varient proteases (see also AAR39713-14) have lower thermal stability than the WT and may be used in soy fermantation microorganisms. Soy produced by these microorganisms may be made into food products which will not be degraded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antibody which recognises a collagen-binding region including CNA19 of CNA protein from Staphylococcus aureus. This artibody is cross-reactive to collagen binding region of both S. aureus and S. epidermidis. It is useful for preventing or treating S. aureus or S. epidermidis infection in human or animal, and for displacing S. aureus or S. epidermidis bound to collagen. Antibody of the invention is useful for interfering with, modulating, and inhibiting the binding interactions between Staphylococcal bacteria and collagen, for detecting the presence of Staphylococcal bacteria or Staphylococcal collagen or binding proteins, to diagnose Staphylococcal immunisation against Staphylococcal infections, as research tools, for development of vaccine for passive immunisation against Staphylococcal infections, and in production facilities or laboratories to isolate additional quantities of collagen-binding proteins. It is also useful for treating medical instruments in order to reduce or eliminate the possibility of them becoming infected or further spreading the infection. The present sequence is S. aureus CNA19 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

These varient proteases have either Cys6 or Cys78 substituted with an amino acid which has no -SH group. These varient proteases have lower thermal stability than the WT and may be used in soy fermantation microorganisms. Soy produced by these microorganisms may be made into food products which will not be degraded by the presence of protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                based on the Aspergillus oryzae protease sequence (see also AAR39711). These varient proteases have either Cys6 or Cys78 substituted with an amino acid which has no -SH group. These varient proteases have lower thermal stability than the WT and may be used in soy fermantation microorganisms. Soy produced by these microorganisms may be made into food products which will not be degraded by the presence of protease.

The polynucleotide sequence given in AAA78381 to AAA78432 encode the human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; antianaemic; antidabetic; antinflammatory; ophthalmological; antirheumatic; antiarthritic; antiporiatic; antimicrobial and antiparkinsonian.

Thuman secreted protein polynucleotides, polypeptides, antagonists and/or agonists may be useful in treating, preventing, and/or diagnosing other disorders of the immune system; (c) angiogenesis disorders; (b) disorders of the immune system; (c) angiogenesis disorders; (d) hyperproliferative disorders; (e) cardiovascular disorders; (f) diseases associated with increase apoptosis; (g) neurological diseases; and sociated with increase apoptosis; (g) neurological diseases; and hipercious diseases. They are also used to promote wound healing.

AAA78372 to AAA78380 and AAB24436 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ţ

This protein comprises Staphylococcus aureus collagen binding protein (GBP) epitope M31, i.e. amino acids 61-343 of full-length comprises District Claimed 441, 849 and 1500 bp nucleic acid sequences (see AAT93436-38) respectively encode CBP epitopes M17, M31 and M55 (see AAT93436-38) respectively encode CBP epitopes M17, M31 and M55 (see AAT93436-38) respectively concern concerns and be used in the recombinant production of the CBP epitopes. The CBP protein and antigenic epitopes are contemplated for use in the treatment of pathological infections, especially to prevent bacterial adhesion to collagen. The claimed nucleic acids as well as claimed anti-CBP antibodies will also be of use in serion and methods for the prevention of bacterial colonisation in an animal such as a human. The CBP catches and as carrier proteins in vaccine formulations, as well as inthe formulation of compositions for the prevention of S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antibody that interacts with collagen binding domain of Staphylococcal cna gene product – useful to prevent bacterial sepsis in animal infected with Staphylococcus aureus

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The case and so used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques (C restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical inspirators involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences. Abg00010-Abg30377 represent novel human and amino acid sequences. Abg0010-Abg30377 represent novel human and mannary and and approaches of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                       Human; chromosome mapping; gene mapping; gene therapy; forensic. food supplement; medical imaging; diagnostic; genetic disorder.

AAM2563. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; cardiants. inflammatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; cardiandemic; antiadementic; uninerary; antibactic; observable; dermatological; antialengenic; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; of inflammaticial and polynucleotides are useful for screening for apondatis of antidaponists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation; rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombooytopaenia, wounds, burns, ulcers, cateniniis, asthma, diabetes, cancer, multiple sclerosis, depression, all all and disorders.

Alzhehmer's disease, Parkinson's disease, neurodegenerative and envological disorders.
                                                                                                                                                antibrilarmatory; antirheumatic; antiarthritic; immunosuppressive; antibracterial; endocrine; cardiant; central nervous system; virucide; antibracterial; endocrine; cardiant; central nervous system; virucide; anti-HTV; fungicalde; antimutagen; cardiovascular; antianaemic; anamia; ecramic dermatopogical; antialergic; antiasthmatic; antidabetic; cytostatic; neuroprotective; antidapersesant; nootropic; antiparkinsonian; infection; immunostimulant; gene therapy; antisense therapy; vaccine; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; panoreatitis; cardiac dysfunction; neuropathology; cardiac anaphylaxis; autoimmunity; genetic disease; haematopoietic disorder; platelet disorder; asthma; thrombocytopaenia; osteoporosis; severe combined immunodeficiency; allergic rhinitis; diabetes; multiple sclerosis; depression; Alzheimer's disease; Parkinson's disease; neurodegenerative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated human polynucleotides encoding polypeptides, useful for the treatment and diagnosis of e.g. cancer, ulcers and HIV infection -

The present sequence is that of a partial sequence of human SOC-2/CRAC-1 (full-length sequence given in AAY95435), as deduced from a partial cDNA clone (see AAA4918). SOC-2/CRAC-1 is a member of a novel family of store operated channel (SOC) or calcium release activated channel (CRAC) polypeptides that modulate Ca2+ flux into and out of a cell, and which may be activated upon depletion of a cell, and which may be activated upon depletion of a cell. SOC-2/CRAC-1 is expressed predominantly in human hamanatopicitic cells, liver, spleen, heart and kidney.

Compositions for expressing functional SOC/CRAC calcium channel polypeptides in cells are expected to be useful for treating patients that have reduced extracellular calcium influx into their polypeptides in cells are expected to such cells to modulate therapeutic and/or imaging agents to such cells to modulate colleration and growth. SOC/CRAC polypeptides also represent traces for designing and/or identifying inhibitors that block lymphocyte proliferation and binding agents that selectively bind to SOC/CRAC polypeptides to which drugs or toxins can be conjugated to SOC/CRAC expressing cells. Methods for determining the level of SOC/CRAC expressing cells. Methods for determining the level of soc/CRAC expressing in a subject can be used to assess the presence, or absence, or stage of a proliferative disorder,
                                                                                                                                                                                                                                diagnose and treat proliferative disorders associated with the channel, and to screen for novel modulators of the channel
                                                                                                                                                                                New SOC/CRAC calcium channel polynucleotides and polypeptides used to
                                                                                                                                                                                                                                                                                                                                                                                                           Claim 14; Page 58-59; 108pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -OCT-1999
```

The invention relates to isolated human polypeptides (which may be cytokines) and the polynucleotides encoding them. The protein is useful for identifying a compound which binds to it (e.g. modulators, agonists and antagonists). The polynucleotides are useful as an array for mismatch detection. The proteins and nucleic acids are useful as nutritional sources or supplements. The protein exhibits exhibits activity relating to cytokine, cell proliferation, cell differentiation, antiinflammatory, stem cell growth factor activity, immune stimulating or immune suppressing and activin or inhibin related activities. The proteins (and antibodies raised against them) and nucleic acids are therefore useful in the diagnosis and treatment of diseases and disorders such as cancer, central and peripheral nervous system diseases and neuropathies, Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic New polypeptides and nucleic acids, useful for diagnosis, treatment of inflammatory, autoimmune, neurological, myeloid or lymphoid cell, bone degenerative disorders, cancer and promoting wound healing

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical faugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapphing, and in recombinant production of (II). The cand gene mapphing are also used in diagnostics as expressed sequence tags of righting expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a polosopeptide in tissue, as molecular weight markers and as a candood supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and annino acid sequences of the invention.
                                                                                                                                                                                     ö
(ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically encoding the mer also useful for producing the proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in
Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; vaccination; gene therapy; nutritional supplement;
stem cell proliferation; haematopoiesis; nerve tissue regeneration;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (syndrits, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Pracence is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as chagnostic agents for determining P. acnes presence, for example, by conzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed and contactive in the contactive intention of a pating o

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating clsories involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human consistic amino acid sequences of the invention.

Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of a polynucleotide which comprises one of a ligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the opplynucleotide which comprises a 3'-end sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length AAH13638 and AAH13633 to AAH13642 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

Regulating mucus secretion by a mucus-secreting cell, useful for treating e.g. bronchitis, asthma or pneumonia, by administering a compound that inhibits or enhances myristolated alanine-rich C-kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of human myristoylated alanine-rich C kinase substrate MARCKS protein, a major cellular substrate. The invention relates to methods of inhibiting mucus secretion by a mucus. Secreting cell by administering a compound that inhibits MARCKS protein-related mucus secretion. Such compounds include active fragments of MARCKS protein such as MANS peptide (see AAY95897) and MA-PDS peptide (see AAY95897), which corresponds to a phosphorylation site of MARCKS. The inhibitor compounds can be used to treat conditions such as bronchitis, cystic fibrosis, chronic obstructive pulmonary disease, asthma, emphysema, pneumonia, influenza, rhinitis and the common cold. An alternative sequence for MARCKS is provided in AAY95899, which differs from the present sequence at 2 amino acid residues, Ala-84 (Ser) and
                                                                 MARCKS; myristoylated alanine-rich C kinase substrate; human; mucus secretion; inhibitor; bronchitis; asthma; cystic fibrosis; chronic obstructive pulmonary disease; pneumonia; empysema; influenza; rhinitis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 19; DB 21; Length 332;

RESULT
                                                    The present sequence is that of human myristoylated alanine-rich C kinase substrate MARCKS protein, a major cellular substrate. The invention relates to methods of inhibiting mucus secretion by a mucus secreting cell by administering a compound that inhibits MARCKS protein-related mucus secretion. Such compounds include cardive fragments of MARCKS protein such as MANS peptide (see AAY95897) and MA-PDS peptide (see AAY95897), which corresponds to phosphorylation site of MARCKS. The inhibitor compounds can be used to treat conditions such as bronchlits, cystic fibrosis, chronic obstructive pulmonary disease, asthma, emphysema, pneumonia, influenza, rhinitis and the common cold. An alternative sequence for MARCKS is provided in AAY95898, which differs from the present sequence at 2 amino acid residues, Ser-84 (Ala) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Regulating mucus secretion by a mucus-secreting cell, useful for treating e.g. bronchitis, asthma or pneumonia, by administering a compound that inhibits or enhances myristolated alanine-rich C-kinase
                                                                                        MARCKS; myristoylated alanine-rich C kinase substrate; human; mucus secretion; inhibitor; bronchitis; asthma; cystic fibrosis; chronic obstructive pulmonary disease; pneumonia; empysema; influenza; rhinitis; therapy.

                                    The present sequence is the sequence for the zebrafish heat shock protein-binding protein (HspBPF), which is involved in the regulation of the heat shock proteins, which are components of the development, apoptosis and cellular stress pathways. The human homologue is useful not only for research into these areas, but also for treating disorders such as heart disease, hypoxia and cancer.
                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of nucleotide and protein as sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

Schroeder H, Zelder O, Haberhauer G;

WPI; 2001-061974/07 N-PSDB; AAF71225.

New isolated Corynebacterium glutamicum nucleic acid for production or modulation of production of fine chemicals such as amino acids, nucleosides, nucleotides, lipids, fatty acids, carbohydrates, vitamins

Claim 20; Page 383-384; 712pp; English.

g δ

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis and adaptation (HA) proteins given in AAB79023 to AAB79242. The c. glutamicum HA genes (1) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, light, saturated or unsaturated tatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, polyketide or enzyme. The amino acids produced can be lysine, glutamine, glutamine, aparine, aspartate, glycine, serine, threonine, methionine, tyrosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (1) or HA proteins encoded by then are used for dlagnosing the presence or activity of Corynebacterium diphtheriae. (1) can be used to map the C. glutamicum genome or can be used as markers for genetically engineered Corynebacterium or previbacterium. The HA proteins encoded by the (1) are used to maintain homeostasis in C. glutamicum or help the microorganism to adapt to different environmental conditions.

and adaptation (HA) proteins given in AAB79023 to AAB79242. The call adaptation (HA) proteins given in AAB79023 to AAB79242. The cells and production of fine chemicals, such as, an organic acid, cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, polyketide or enzyme. The amino acids produced can be lysine, glutamine, glutamate, alanine, aspartate, glycine, serine, threonine, methionine, cysteine, valine, leucine, isoleucine, arginine, proline, histidine, tryosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are used for diagnosing the presence or activity of Corynebacterium diphtheriae. (I) can be used to map the C. glutamicum genome or can be used as markers for genetically engineered Corynebacterium or presentine. The HA proteins encoded by the (I) are used to maintain homeostasis in C. glutamicum or help the microorganism to adapt to different environmental conditions.
AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis

describes a new protease deficient filamentous fungus, optionally with reduced extracellular acid protease activity, containing a site selected disruption of DNA resulting in reduced metallo-protease activity. The fungi are useful for the production of (heterologous and homologous) proteins e.g. for food processing, since reduced protease activity. The fundialses the chance that, and rate at which, the proteins are degraded withinses the chance that, and rate at which, the proteins are degraded used to production. DNA sequences encoding metallo-proteases activity as used to produce metallo-protease activity. They are also used to produce metallo-protease activity. They are also useful for producing filamentous fungia with reduced metallo-protease activity. They are also useful for producing filamentous fungia metallo-protease. By culturing filamentous fungia transformed with the constructs under suitable conditions for sequence expression and recovering the metallo-protease. Such metallo-proteases are useful to assess in vitro whether proteins which it is proposed to produce from a fungal host are susceptible to the protease, so determining which metallo-protease genes need to be
                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The neutral protease II can be expressed in Saccharomyces cerevisae and can be produced efficiently and in a secreted form.
                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella premioniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen corporate for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.

The invention provides methods and compositions relating to altering lighth biosynthesis and/or the lighth composition of plants. Isolated nucleic acids (see AAX25196.216) that code for proteins (see AAV05657-77) involved in lighth biosynthesis are claimed. Also claimed are recombinant expression cassettes, host cells (especially maize or sorghum), and transgenic plants and seeds. The claimed nucleic acids can be used to transform a plant to modulate lighth biosynthesis. A claimed method involves transforming a plant cell with a recombinant expression cassette comprising a lighth biosynthesis polynucleotide operably linked to a promoter, growing the plant cell under plant gent of a time sufficient to modulate (preferably increase) lighth biosynthesis in the plant. The plant lightins can be used as chemical feedstock. Plant material of increased lighth content can be used as a fuel source, and in the pulp and paper industry. Decreased lighth content can be used as a fuel source, improves the digestibility of fodder crops.

Human serine protease inhibitor from cDNA clone HETDK50; fusion protein; serpin; serine protease; human pre-alpha-1-antitrypsin precursor; extracellular matrix degradation; multiple sclerosis; cancer; arthritis; inflammation; immune system disorder; neurodegenerative disorder; Kallmann's syndrome; Down's syndrome; Alzheiner's; secreted protein; galactorrhea; hypogonadism; somatostatin; protein purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a serine protease inhibitor (serpin) from CDNA clone HETDK50 which is obtained from human endometrial tumour tissue cDNA library. The protein shows a high degree of sequence similarity to human pre-alpha-1-antitrypsin precursor. The serpin and its coding sequence are used in the diagnosis and treatment of disorders related to abnormal level of the protein or mutation in the nucleotide sequence. The serpin can be used for treating disorders characterised by degradation of extracellular matrix, e.g. cancer, arthritis, multiple sclerosis and immune system disorders, for treating wasting associated
immunogenic compositions as vaccines. Vectors containing C. pneumonia nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated human serine protease and serpin polypeptides, used to develop products for treating e.g. immune disorders, cancers, inflammation, transplant rejection or infections, or as food

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent oitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                         Product is a biosynthetic component involved in the synthesis of protease. The protein may be produced from a transformed S.cerevisiae expression system for the large scale production of protease.

refines of the first care and processor care and the first care and prevention of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome, care combined immunodeficiency disease (SCID), Chediak-Higashi syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis, Crohn's disease, Hashimot's thyroiditis, Siogren's syndrome, wiral, bacterial, impal, parasitic, processor, and helminthic infections and cell proliferative disorder such as arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM polynucleotide sequences can be used in somatic or germline gene therapy and in diagnosis of diseases. They can also be used in generating subtribution probes useful in mapping the naturally occurring genomic sequences and in molecular biology techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5, Application US/08405175A
Patent No. 5885772
GENERAL INFORMATION:
APPLICANT: Aderem, Alan A.
APPLICANT: Chen, Jianmin
APPLICANT: Chen, Sandy
TITLE OF INVENTION: METHOD FOR THE DETECTION OF ANENCEPHALX
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: Klauber & Jackson
                                                                                                                                                                                 APPLICANT: Hook, Magnus
APPLICANT: Patti, Joseph M.
APPLICANT: Patti, Joseph M.
APPLICANT: House-Pompeo, Karen
APPLICANT: Sthanam, Narayana
APPLICANT: Symersky, Jindrich
TITLE OF INVENTION: COLLAGEN BINDING PROTEIN COMPOSITIONS
TITLE OF INVENTION: AND METHODS OF USE
CORRESPONDENCE ADDRESS:
ADDRESSEE: Arnold, White & Durkee
STREET: P.O. Box 4433
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 211;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CONFIRE TO S.
